

# Embedding single objects

## todo

- get app id and tempBookmark id from url param
- use @qlik/api with oauth2 access token to opendoc - qix
- apply tempBookmark
- get app sheets
- in each sheet, get objects
- if object is image worthy (barchart, linechart etc.) - use qlik-embed
- if kpi => height = 200
- if object is table worthy - get hypercubeData and render with html (or figure out height and render with qlik-embed?)
- when done rendering - puppet will create a pdf from the page

## Issues

- "classic/chart" should work with extensions. Jeff G submitted a bug
